

**USER CONFERENCE PARTICIPANTS AND COMPANY PARTNER
TO DEVELOP NEW SOFTWARE**

2nd Annual Conference reiterates client partnership and customer-focused philosophy

Weston, FL (June ##, 2007) – gMed, an EMR software development and support company, knows the important role client feedback plays in expanding and enhancing product lines. This proactive mindset led the company to hold its second annual *User Conference* May 2-4, 2007, at Disney World Resorts, attended by more than 75 gastroenterology specialty clients.

Among the many topics, attendees discussed the upcoming launch of gCare® Version 4.0. Sessions included exposure to the programs' functionality and increasing program-use efficiency, thus enabling better quality of care.

“This conference helps form a working partnership, and is beneficial to both us and the client,” said Joe Rubinsztain, M.D., CEO. “We bring our users together for first-hand feedback on the programs so the solutions we design are tailored for them.”

Efficiency and effectiveness mark the driving goals of the conference each year. Discussions focus on user efficiency in connecting with labs and co-workers while effectively coding and collaborating documentation to further assist patients. Valuable

feedback on the seminars is helping gMed put the final touches on the solution, gCare® V4.0, set to release in mid-July.

gCare® V4.0, designed with interoperability and ergonomics in mind, will be a driving force in EMR software. The revolutionary application has been developed taking into consideration specialty requirements of physicians and ease of use.

The pre-configured software designed with specialty-specific knowledge saves time when launching into the solution. By transitioning to user-friendly electronic documentation, medical personnel can increase organization and save time by managing administrative tasks such as reviewing records, updating charts, communicate with co-workers and managing billing.

The version incorporates new programming technologies to create a faster and more efficient link between pages within each medical record. Bar code processing and increased connection to pharmacies and laboratories highlight a few of the tools focused on efficiency.

“With version 4.0, the system uploads information directly from pharmacies so medical personnel can provide medication and dosage information directly to patients,” said Sam Rubinsztain, vice president of product development. “By combining this with the ability to dig further into reports, diagnosis and evaluation benefits both parties.”

Version 4.0 reiterates gMed’s core capabilities. The program’s easy navigation, intuitiveness and standardized interface alleviate issues involved with paper
